

Controller for temperature control

- EKC 202C-MS

Introduction

Application

- The controller is used for temperature control refrigeration appliances and cold room in supermarkets
- · Control of defrost, fans, alarm and light
- For front panel mounting
- Signal from NTC sensors

Principle

The controller contains a temperature control where the signal can be received from one temperature sensor.

The sensor is placed in the cold air flow after the evaporator or in the warm air flow just before the evaporator.

The controller controls the defrost with either natural defrost or electric defrost. Renewed cutin after defrost can be accomplished based on time or temperature.

A measurement of the defrost temperature can be obtained directly through the use of a defrost sensor.

Four relays will cut the required functions in and out – the application determines which:

- Refrigeration (compressor or solenoid valve)
- Defrost
- Fan
- · Alarm or light

Advantages

- · Integrated refrigeration-technical functions
- Defrost on demand in 1:1 systems
- Buttons and seal imbedded in the front
- IP65 density from the front panel
- Digital input for either:
- Door contact function with alarm
- Defrost start
- Start/stop of regulation
- Night operation
- Change-over between two temperature reference
- Case cleaning function
- · Instant programming via programming key
- Sensor signal from NTC sensor (adjustable)
- HACCP

Calibration option so that the EN 441-13 standard can be fulfilled.

Extra module

• The controller can afterwards be fitted with an insertion module if the application requires it.

The controller has been prepared with plug, so the module simply has to be pushed in

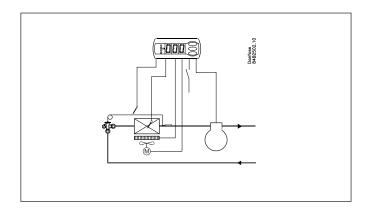

- Battery and buzzer module

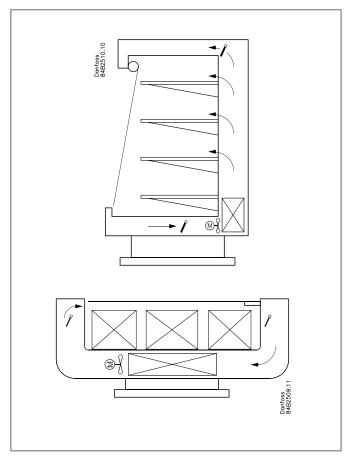

The module guarantees voltage to the controller if the supply voltage should drop out for more than four hours. The clock function can thus be protected during a power failure.

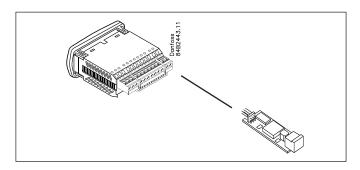

- Data communication

If you require operation from a PC, a data communication module has to be placed in the controller.

- Coordinated defrost via data communication

Outputs and Inputs

Controller with four relay outputs, two temperature sensors and digital input.

- Temperature control at start/stop of compressor / solenoid valve
- Defrost sensor must be connected when defrosting stop is performed by temperature
- If defrosting stop is performed on time, the sensor can be used either for monitoring the condenser temperature or as a product sensor
- Electrical defrost / gas defrost
- Control of fan
- Relay output 4 can be used for an alarm function or for a light function.

Sensors

One or two NTC sensors of the same type must be connected.

The following can be selected: NTC 5000 Ω @ 25°C. M2020 (Danfoss Type = EKS 211) NTC 10000 Ω @ 25°C. Beta 3435 (Danfoss Type = EKS 221) NTC 3000 Ω @ 25°C NTC 2500 Ω @ 0°C NTC 10000 Ω @ 25°C NTC 2000 Ω @ 25°C

Set the type in menu o06.

Start of defrost

A defrost can be started in different ways

Interval: Defrost is started at fixed time intervals, say, every

eight hour

Refrigeration time:

Contact

Defrost is started at fixed refrigeration time inter-

vals, in other words, a low need for

refrigeration will "postpone" the coming defrost

Defrost is started here with a pulse signal on a

digital input.

Manual: An extra defrost can be activated from the control-

ler's lower-most button

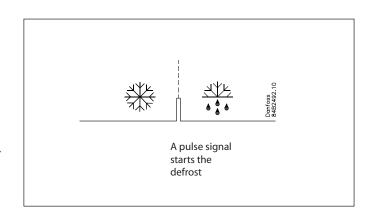

S5-temp. In 1:1 systems the efficiency of the evaporator can

be followed. Icing-up will start a defrost.

Schedule Defrost here can be started at fixed times of the

day and night. But max. six defrosts

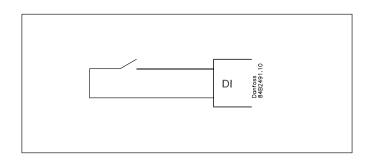

Network A defrost can be started via data communication All the mentioned methods can be used at random – if just one them is activated a defrost will be started. When the defrost starts the defrost timers are set at zero

Digital input

The digital input can be used for the following functions:

- Door contact function with alarm if the door has been open for too long.
- Defrost start
- Start/stop of regulation
- Change-over to night operation
- Case cleaning
- Change to another temperature reference
- Inject on/off

Case cleaning function

This function makes it easy to steer the refrigeration appliance through a cleaning phase. Via three pushes on a switch you change from one phase to the next phase.

The first push stops the refrigeration – the fans keep working "Later": The next push stops the fans

"Still later": The next push restarts refrigeration

The different situations can be followed on the display.

There is no temperature monitoring during case cleaning.

On the network a cleaning alarm is transmitted to the system unit. This alarm can be "logged" so that proof of the sequence of events is provided.

E-_			<u></u>
-	+	+	°C
1	÷	+	Fan
2	÷	÷	Off
3	+	+	°C

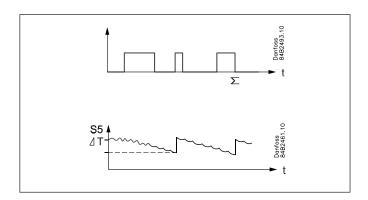

Defrost on demand

1 Based on refrigeration time When the aggregate refrigeration time has passed a fixed time, a defrost will be started.

2 Based on temperature

The controller will constantly follow the temperature at S5. Between two defrosts the S5 temperature will become lower the more the evaporator ices up (the compressor operates for a longer time and pulls the S5 temperature further down). When the temperature passes a set allowed variation the defrost will be started.

This function can only be used in 1:1 systems

Operation

Display

The values will be shown with three digits, and with a setting you can determine whether the temperature are to be shown in °C or in °F.

Light-Emitting Diodes (LED) on front panel

There are LED's on the front panel which will light up when the belonging relay is activated.

= Refrigeration

= Defrost

Fan

The light-emitting diodes will flash when there is an alarm. In this situation you can download the error code to the display and cancel/sign for the alarm by giving the top button a brief push.

Defrost

During defrost a -d- is shown in the display. This view will continue up till 15 min. after the cooling has resumed. However the view of -d- will be discontinued if:

- The temperature is suitable within the 15 minutes
- The regulation is stopped with "Main Switch"
- A high temperature alarm appears

The buttons

When you want to change a setting, the upper and the lower buttons will give you a higher or lower value depending on the button you are pushing. But before you change the value, you must have access to the menu. You obtain this by pushing the upper button for a couple of seconds - you will then enter the column with parameter codes. Find the parameter code you want to change and push the middle buttons until value for the parameter is shown. When you have changed the value save the new value by once more pushing the middle button

Examples

Set menu

- 1. Push the upper button until a parameter r01 is shown
- 2. Push the upper or the lower button and find that parameter you want to change
- 3. Push the middle button until the parameter value is shown
- 4. Push the upper or the lower button and select the new value
- 5. Push the middle button again to enter the value.

Cutout alarm relay / receipt alarm/see alarm code

• Push briefly the upper button

If there are several alarm codes they are found in a rolling stack. Push the uppermost or lowermost button to scan the rolling stack.

Set temperature

- 1. Push the middle button until the temperature value is shown
- 2. Push the upper or the lower button and select the new value
- 3. Push the middle button to select the setting

Manual start or stop of a defrost

• Push the lower button for four seconds.

See the temperature at the defrost sensor

Push briefly the lower button

If no sensor has been mounted, "non" will appear.

100% tight

The buttons and the seal are imbedded in the front. A special moulding technique unites the hard front plastic, the softer buttons and the seal, so that they become an integral part of the front panel. There are no openings that can receive moisture or dirt.

				PS	Password required. Set password

Start-up:

Regulation starts when the voltage is on.

- 1 Go through the survey of factory settings. Make any necessary changes in the respective parameters.
- 2 For network. Set the address in o03 and then transmit it to the gateway/ system unit with setting o04.

Functions

Here is a description of the individual functions.

Function	Para- meter	Parameter by operation via data communication
Normal display		
Normally the temperature value from thermostat sensor Sair is displayed.		Display air (u69)
Thermostat		Thermostat control
Set point Regulation is based on the set value plus a displacement, if applicable. The value is set via a push on the centre button. The set value can be locked or limited to a range with the settings in r02 and r 03. The reference at any time can be seen in "u28 Temp. ref"		Cutout °C
When the temperature is higher than the reference + the set differential, the compressor relay will be cut in. It will cut out again when the temperature comes down to the set reference. Ref. Dif.	r01	Differential
Setpoint limitation The controller's setting range for the setpoint may be narrowed down, so that much too high or much too low values are not set accidentally - with resulting damages.		
To avoid a too high setting of the setpoint, the max. allowable reference value must be lowered.	r02	Max cutout °C
To avoid a too low setting of the setpoint, the min. allowable reference value must be increased.	r03	Min cutout °C
Correction of the display's temperature showing If the temperature at the products and the temperature received by the controller are not identical, an offset adjustment of the shown display temperature can be carried out.	r04	Disp. Adj. K
Temperature unit Set here if the controller is to show temperature values in °C or in °F.	r05	Temp. unit °C=0. / °F=1 (Only °C on AKM, whatever the setting)
Correction of signal from Sair Compensation possibility through long sensor cable	r09	Adjust Sair
Start / stop of refrigeration With this setting refrigeration can be started, stopped or a manual override of the outputs can be allowed. Start / stop of refrigeration can also be accomplished with the external switch function connected to the DI input. Stopped refrigeration will give a "Standby alarm". Night setback value The thermostat's reference will be the setpoint plus this value when the controller changes over	r12	Main Switch 1: Start 0: Stop -1: Manual control of outputs allowed Night offset
to night operation. (Select a negative value if there is to be cold accumulation.) Value of reference displacement The thermostat reference and the alarm values are shifted the following number of degrees when the displacement is activated. Activation can take place via r39 or input DI	r39	Th. offset
o Signature of the control of the co		
Værdi for referenceforskydning Termostatreferencen og alarmværdier flyttes følgende antal grader, når forskydningen aktiveres. Aktiveringen kan ske via r39 eller DI indgangen	r40	Th. offset K
		Night setbck (start of night signal)

Alarm		Alarm settings
The controller can give alarm in different situations. When there is an alarm all the light-emitting diodes (LED) will flash on the controller front panel, and the alarm relay will cut in.		With data communication the importance of the individual alarms can be defined. Setting is carried out in the "Alarm destinations" menu.
Alarm delay (short alarm delay) If one of the two limit values is exceeded, a timer function will commence. The alarm will not become active until the set time delay has been passed. The time delay is set in minutes.	A03	Alarm delay
Time delay for door alarm The time delay is set in minutes. The function is defined in o02.	A04	DoorOpen del
Time delay for cooling (long alarm delay) This time delay is used during start-up, during defrost, immediately after a defrost. There will be change-over to the normal time delay (A03) when the temperature has dropped below the set upper alarm limit. The time delay is set in minutes.	A12	Pulldown del
Upper alarm limit Here you set when the alarm for high temperature is to start. The limit value is set in °C (absolute value). The limit value will be raised during night operation. The value is the same as the one set for night setback, but will only be raised if the value is positive. The limit value will also be raised in connection with reference displacement r39.	A13	HighLim Air
Lower alarm limit Here you set when the alarm for low temperature is to start. The limit value is set in °C (absolute value). The limit value will also be raised in connection with reference displacement r39.	A14	LowLim Air
Delay of a DI alarm A cut-out/cut-in input will result in alarm when the time delay is passed. The function is defined in o02.	A27	Al.Delay DI
High alarm limit for condenser temperature If the S5 sensor is used for monitoring the condenser's temperature you must set the value at which the alarm is to become activated. The value is set in °C. The definition of S5 as condenser sensor is accomplished in o70. The alarm is zeroset again 10 K below the set temperature.	A37	Condtemp Al.
Solo in the set temperature.		Reset alarm
Compressor		Compressor control
The compressor relay works in conjunction with the thermostat. When the thermostat calls for refrigeration will the compressor relay be operated.		
Running times To prevent irregular operation, values can be set for the time the compressor is to run once it has been started. And for how long it at least has to be stopped. The running times are not observed when defrosts start.		
Min. ON-time (in minutes)	c01	Min. On time
Min. OFF-time (in minutes)	c02	Min. Off time
Reversed relay function for compressor relay 0: Normal function where the relay cuts in when refrigeration is demanded 1: Reversed function where the relay cuts out when refrigeration is demanded (this wiring produces the result that there will be refrigeration if the supply voltage to the controller fails).	c30	Cmp relay NC
Defrost		Defrost control
The controller contains a timer function that is zeroset after each defrost start. The timer function will start a defrost if/when the interval time is passed. The timer function starts when voltage is connected to the controller, but it is displaced the first time by the setting in d05. If there is power failure the timer value will be saved and continue from here when the power returns. This timer function can be used as a simple way of starting defrosts, but it will always act as safety defrost if one of the subsequent defrost starts is not received. The controller also contains a real-time clock. By means of settings of this clock and times for the required defrost times, defrost can be started at fixed times of the day. If there is a risk of power failure for periods longer than four hours, a battery module should be mounted in the controller. Defrost start can also be accomplished via data communication, via contact signals or manual		
All starting methods will function in the controller. The different functions have to be set, so that defrosts do not "come tumbling" one after the other. Defrost can be accomplished with electricity, hotgas or brine. The actual defrost will be stopped based on time or temperature with a signal from a temperature sensor.		

Defrost method	d01	Def. method
Here you set whether defrost is to be accomplished with electricity or "non".		
During defrost the defrost relay will be cut in.		
When gas defrosting the compressor relay will be cut in during defrost.		
Defrost stop temperature	d02	Def. Stop Temp
The defrost is stopped at a given temperature which is measured with a sensor (the sensor is		
defined in d10). The temperature value is set.		
	100	D (1)
Interval between defrost starts	d03	Def Interval
The function is zeroset and will start the timer function at each defrost start. When the time has expired the function will start a defrost.		(0=off)
The function is used as a simple defrost start, or it may be used as a safeguard if the normal		
signal fails to appear.		
If master/slave defrost without clock function or without data communication is used, the inter-		
val time will be used as max. time between defrosts.		
If a defrost start via data communication does not take place, the interval time will be used as		
max. time between defrosts.		
When there is defrost with clock function or data communication, the interval time must be set		
for a somewhat longer period of time than the planned one, as the interval time will otherwise		
start a defrost which a little later will be followed by the planned one.		
In connection with power failure the interval time will be maintained, and when the power		
returns the interval time will continue from the maintained value.		
The interval time is not active when set to 0.		1
Max. defrost duration	d04	Max Def. time
This setting is a safety time so that the defrost will be stopped if there has not already been a		
stop based on temperature or via coordinated defrost.		
(The setting will be the defrost time if d10 is selected to be 0)	los	T: C:
Time staggering for defrost cutins during start-up	d05	Time Stagg.
The function is only relevant if you have several refrigeration appliances or groups where you		
want the defrost to be staggered in relation to one another. The function is furthermore only relevant if you have chosen defrost with interval start (d03).		
The function delays the interval time d03 by the set number of minutes, but it only does it once,		
and this at the very first defrost taking place when voltage is connected to the controller.		
The function will be active after each and every power failure.

		operating with coordinated defrost.
		Defrost State Status on defrost
		1= pump down / defrost
Fan		Fan control
Fan stopped at cut-out compressor	F01	Fan stop CO
Here you can select whether the fan is to be stopped when the compressor is cut out	101	(Yes = Fan stopped)
Delay of fan stop when compressor is cut out	F02	Fan del. CO
If you have chosen to stop the fan when the compressor is cut out, you can delay the fan stop		
when the compressor has stopped.		
Here you can set the time delay.		
Fan stop temperature	F04	FanStopTemp.
The function stops the fans in an error situation, so that they will not provide power to the appliance. If the defrost sensor registers a higher temperature than the one set here, the fans will be		
stopped. There will be re-start at 2 K below the setting.		
The function is not active during a defrost or start-up after a defrost.		
With setting +50°C the function is interrupted.		
Internal defrosting schedule/clock function		
(Not used if an external defrosting schedule is used via data communication.)		
Up to six individual times can be set for the defrost start throughout the day.		
Defrost start, hour setting	t01-t06	
Defrost start, minute setting (1 and 11 belong together, etc.)	t11-t16	
When all t01 to t16 equal 0 the clock will not start defrosts.		
Real-time clock::		
Setting the clock is only necessary when there is no data communication. In the event of a power failure of less than four hours, the clock function will be saved.		
When mounting a battery module the clock function can preserved longer

Max. standby time after coordinated defrost When a controller has completed a defrost it will wait for a signal which tells that the refrigeration may be resumed. If this signal fails to appear for one reason or another, the controller will itself start the refrigeration when this standby time has elapsed.	o16	Max HoldTime
Configuration of light function 1) The relay cuts in during day operation 2) The relay to be controlled via data communication 3) The relay to be controlled by the door switch defined in either o02 where the setting is selected to either 2 or 3. When the door is opened the relay will cut in. When the door is closed again there will be a time delay of two minutes before the light is switched off.	o38	Light config
Activation of light relay The light relay can be activated here (if 038=2)	o39	Light remote
Case cleaning The status of the function can be followed here or the function can be started manually. 0 = Normal operation (no cleaning) 1 = Cleaning with fans operating. All other outputs are Off. 2 = Cleaning with stopped fans. All outputs are Off. If the function is controlled by a signal at the DI input, the relevant status can be seen here in the	o46	Case clean
Menu. Access code 2 (Access to adjustments) There is access to adjustments of values, but not to configuration settings. If the settings in the controller are to be protected with an access code you can set a numerical value between 0 and 100. If not, you can cancel the function with setting 0. If the function is used, access code 1 (005) must also be used.	064	-
Copy the controller's present settings With this function the controller's settings can be transferred to a programming key. The key can contain up to 25 different sets. Select a number. All settings except for Address (003) will be copied. When copying has started the display returns to 065. After two seconds you can move into the menu again and check whether the copying was satisfactory. Showing of a negative figure spells problems. See the significance in the Fault Message section.	o65	-
Copy from the programming key This function downloads a set of settings earlier saved in the controller. Select the relevant number. All settings except for Address (o03) will be copied. When copying has started the display returns to o66. After two seconds you can move back into the menu again and check whether the copying was satisfactory. Showing of a negative figure spells problems. See the significance in the Fault Message section.	o66	-
Save as factory setting With this setting you save the controller's actual settings as a new basic setting (the earlier factory settings are overwritten).	067	-
Other application for S5 sensor Maintain the setting at 0 if the sensor has been defined as defrost sensor in D10. If D10 has been set at 0 or 2 the S5 input can be used as product sensor or condenser sensor. Here you define which: 0: Defrost sensor 1: Product sensor 2: Condenser sensor with alarm	o70	S5 Config
Relay 4 Here you define the application for relay 4: 1: Light 2: Alarm	o72	DO4 Config

		Night Setback 0=Day 1=Night
Service		Service
Temperature measured with S5 sensor	u09	S5 temp.
Status on DI input. on/1=closed	u10	DI1 status
Status on night operation (on or off) 1=closed	u13	Night Cond.
Read the present regulation reference	u28	Temp. ref.
Status on relay for cooling	u58	Comp1/LLSV
Status on relay for fan	u59	Fan relay
Status on relay for defrost	u60	Def. relay
Temperature measured with Sair sensor	u69	Sair temp
Status on relay 4 (alarm or light function)	u71	DO4 status

Fault message	Alarms
In an error situation the LED's on the front will flash and the alarm relay will be activated. If you push the top button in this situation you can see the alarm report in the display. If there are further push again to see them. There are two kinds of error reports - it can either be an alarm occurring during the daily operation, or there may be a defect in the installation.	
A-alarms will not become visible until the set time delay has expired. E-alarms, on the other hand, will become visible the moment the error occurs. (An A alarm will not be visible as long as there is an active E alarm).	
Here are the messages that may appear:	1 = alarm
A1: High temperature alarm	High t. alarm
A2: Low temperature alarm	Low t. alarm
A4: Door alarm	Door Alarm
A5: Information. Parameter o16 is expired	Max Hold Time
A15: Alarm. Signal from DI input	DI1 alarm
A45: Standby position (stopped refrigeration via r12 or DI input)	Standby mode
A59: Case cleaning. Signal from DI input	Case cleaning
A61: Condenser alarm	Cond. alarm
E1: Faults in the controller	EKC error
E6: Fault in real-time clock. Check the battery / reset the clock.	-
E27: Sensor error on S5	S5 error
E29: Sensor error on Sair	Sair error
When copying settings to or from a copying key with functions o65 or o66, the following information may appear: 0: Copying concluded and OK 4: Copying key not correctly mounted 5: Copying was not correct. Repeat copying 6: Copying to EKC incorrect. Repeat copying 7: Copying to copying key incorrect. Repeat copying 8: Copying not possible. Order number or SW version do not match 9: Communication error and timeout 10: Copying still going on (The information can be found in o65 or o66 a couple of seconds after copying has been started).	
	Alarm destinations
	The importance of the individual alarms can be defined with a setting (0, 1, 2 or 3)

Warning! Direct start of compressors *

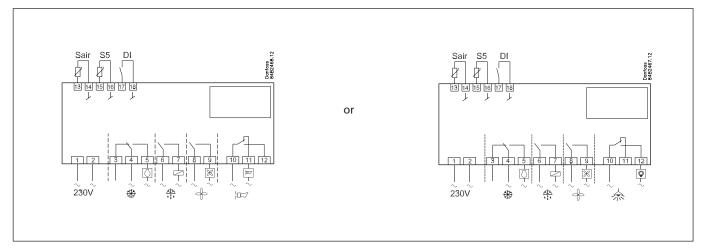

To prevent compressor breakdown parameter c01 and c02 should be set according to suppliers requirements or in general: Hermetic Compressors c02 min. 5 minutes

Semihermetic Compressors c02 min. 8 minutes and c01 min. 2 to 5 minutes (Motor from 5 to 15 KW)

^{*)} Direct activating of solenoid valves does not require settings different from factory (0)

Connections

Power supply

230 V a.c.

Sensors

Sair is thermostat sensors.

S5 is a defrost sensor and is used if defrost has to be stopped based on temperature. It may however also be used as product sensor or condenser sensor.

Digital On/Off signal

A cut-in input will activate a function. The possible functions are described in menu o02.

Relays

The general connections are:

Refrigeration. The contact will cut in when the controller demands refrigeration

Defrost.

Fan.

Alarm. The relay is cut out during normal operation and cuts

in in alarm situations and when the controller is dead

(de-energised)

Light. The contact will cut in when the controller

demands light.

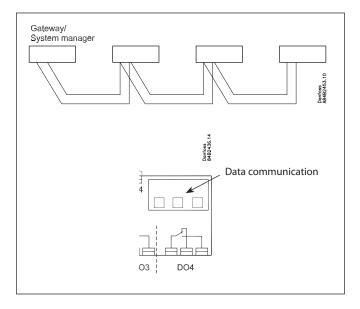

Electric noise

Cables for sensors, DI inputs and data communication must be kept separate from other electric cables:

- Use separate cable trays
- Keep a distance between cables of at least 10 cm
- Long cables at the DI input should be avoided

Data communication

If data communication is used, it is important that the installation of the data communication cable is performed correctly. See separate literature No. RC8AC..
